

iOS team meeting 26 February 2018

Present: Andrei, Zino, Tom and Marc. (Andrew of Web team dropped by)

We discussed the comments that were still open on the requirements document and resolved them.

Certain (preliminary) decisions we implemented in the requirements document:

- Keep consistent naming for devices that are controlled by the iOS application (through the server). We call these peripherals to avoid confusing with for example the device where the application is installed on.
- Call the app to be developed application.
- Some requirements regarding scheduled control were merged.

We found that in the introduction more distinction should be made between what already is there and what will be implemented. Andrei will change it. He will also add a better version of the logo from the original Hestia 2017 documentation.

We discussed the GitHub workflow and tested this by committing the preliminary PDF of the requirements document to a new branch and making a pull request to development. Direct committing to developed was not possible, as expected.

We discussed some functionalities of the Trello board and added more lists and cards.

Andrew suggested to coordinate the choice of colors for the design with the Web team.

We concluded that for the next sprint design of the app is most important , so the functional requirements play a less prominent role first.
