

iOS team meeting 7 March 2018

Present: Entire team, at the start Feiko also present.

Feiko's notes:

- Separate folders such that it is more clear.
- New iteration of the requirements document.
- Maybe get another workshop on the workings of the API.
- First iteration of the architecture document is necessary for next sprint. Explain decisions regarding design and possible alternatives that were examined. Also explain decisions about backend and coding (APIs, libraries etc.) . It would be a good to already start working on the code.

It was noted that it is only a short time till the MVP has to be ready.

We discussed the prototypes of screens that were already created before the meeting. Some points that were discussed:

- There should be a settings screen that is accessible from the devices screen such that information about the server can be seen and can be disconnected from the server
- In that settings screen also login information should be viewed/changed
- The + button to add a devices should go somewhere else to make room for this settings button.
- A search bar could be a useful if many devices are present.
- Devices should be displayed per category

Decided on the following:

Front end	Back end	Fillers
Geanne	Jur	Tom
Marc	Daan	Juan
Andrei	Zino	

Fillers work on the side of the project that turns out to be the most work. Design wise we agreed that the people making parts of the project, mainly design wise will also write a little part about this in the architecture document.

We put tasks on the Trello board (labeled front end/back end) that a member of that group can swipe to doing and start working on that.
