

Team meeting notes May 9, 2018.

Present: Tom, Zino, Juan, Daan and Marc

We discussed that a few members of the team are not responding to Doodles and do not seem to do any work. Zino will notify Feiko about this.

Juan had a problem with merging his branch back in development, we will help him fix it.

Daan asked how that auth0 worked. We have a token and should send that to the webserver to request Servers etc. Zino and Marc had already tested it with Troy and could get the token.

Marc had difficulty and with branching from auth0, he couldn't see the commits from that branch. He probably did something wrong. Zino will help to restore things.

About UITesting. Mar will send Tom a link, he will start soon with it.

Juan did not find any more big bugs in the app yet besides the known ones, he will keep looking. We were wondering if the "add-Philips-device-crashed-server-bug" was already fixed.

Daan thought that it is not yet working.

Juan had problems with setting the background color with the Globals.lightgray background color, it became black.

It seemed to be possible that we could add devices without names in the app. Juan will add regex in add device.

The namespaces in frontend are not consistent. This should be fixed, but we thought it is not a good idea to do that when people are still working in the front end classed. So it should be done shortly before the sprint deadline. Maybe there is a quick refactoring fix, but no one knew.

Currently, rows can be selected in the activators screen. That is kind of a bug. It should not be possible to select rows in that screen.

Indentation is not fixed yet. Tom did look at it but it is not easy to fix. Tom is still going to look at it but UITesting first. We are not really happy with the images, but are not certain if we can find anything better.

We discussed the design for the entrance screen where one can choose local/global. We decided that buttons with rounded edges would be nice. We were not sure about the color. The Hestia orange from the logo is maybe a bit too sharp. Tom had also tried on the old sign in screen a combination of the blue/yellow on a button but it didn't look nice. Is Global/Local a

good naming? Zino insisted that also dumb people should understand it. Maybe we can switch to Home/Remote as Daan proposed.

We discussed the auth0 login page. We agreed that it would be best to use the default webpage, as making a custom login page would be very hard if not impossible. Marc said that even Google uses the webpage login in for example their Google Drive app.

About the architecture document, everyone who changes code or something should make the corresponding changes in the architecture document.

We talked about the bigger cell, avoiding wasted space. We had a long discussion about this, as we did not agree on where to remove the wasted space and how to solve it. A dropdown menu was suggested as well as make the cell bigger in the devices main screen. What makes it complicated is that you don't know how many activators you have and what kind the first one is. So you don't really know what to display. We decided to contact the customer about it. Tom sent him a Slack message to arrange a meeting to discuss the options for the cell design.

Zino gave Juan an option for an alternative way to display the plugin required info in the add device screen.

Daan will work on voice recognition.

Zino suggested to interchange the Settings and edit button in the devices main screen, because the transition of the settings screen does not make much sense now. Marc will have look at it.

Zino will ask the professor about the Philips Hue light.
