

Meeting notes team meeting 26-04-2018

Present: Tom, Daan, Jur, Juan, Zino, Andrei and Marc. Andrei left after a while, because he had a computer practicum.

We discussed what we should finish before next sprint and divided the Tasks that were still in the to do section of the Trello board.

The other team is going to use auth0, so no Firebase anymore. We should switch to that. It uses Google or Github authentications token and then you will get a list of servers. We connect through them to the server, so the payload has to change. The back end team should finish auth0 authentication for this Tuesday sprint deadline.

In the login screen there should come a checkbox to remember login.

Andrei does the settings screen. More contact information and a logout button should be added to the settings screen. He should also have a look at auto-layout to properly align the elements in the screen.

Tom will do the login screen for multiple servers/auth0.

We discussed if local account creation was necessary and if touch ID should be used. Also we were wondering if one single login screen would be better instead of two separate one which we have now. We decided to first keep it like this and later change it if the customers wants to.

Marc will check if the server popup screen for add device is already finished. Otherwise Tom will do that.

Zino divided the remaining tasks from the Trello board. The assignment to people can be found on the Trello board.

It was suggested to simply use a pincode for the local login. Zino will ask Lars about what he wants.

Zino mentioned that the unit test project crashed appcenter. Zino is going to try to solve that. Marc will look at a developer account for Siri.

Everyone should update the architecture document with what they did.

Zino will make a Doodle for next week's meeting, which will probably be on Friday regarding holidays.
