

Notes team meeting May 3, 2018

After Lars and Feiko left we had some discussion about the task division and about how we would do certain things.

Andrei has to redo the settings screen with the login button, because the one he created had not a proper layout.

In the settings screen the normal logout button should be "disconnect from server" and go back to the choose local/global screen. For local there should be no login.

In settings there should also more about contact information/licences.

For global in the settings screen one should be able to change the selected servers.

Juan said he had finished both his tasks. It should be merged in development. He will look at bugs.

Marc will do automatically go to devices main + auth0 frontend + bigger cell.

Tom will do UI testing.

Everyone in frontend should have a look at auto layout.

Juan will add the display of the required info in the add device screen.

Marc will have a look at placing the add device cell on top and only once for multiple screen and add cancel to each of the add device screens.

Zino showed that his app had stopped working on his phone.

We noticed that there is a bug in the Philips collection or the server, because if we tried to add a Philips device with some random input, the Server crashed. We reported this bug to Feiko. The Android app did not crash but it does crash the server.

We also noted that the add device screen should check that every field is filled in and do regex for each field.

Tom should add a catch exception in the activator screen when setting activator state.

We discussed the new cell layout for the bigger cell that does not waste to much space. We noted that it is difficult to make a general cell, because there is no information about what kind of activators in what order and how many are present. So the kind of tiles in HomeKit are not feasible. We will aim add adding two activators to the cell to cover more space
