Notes meeting customer 19-3-2018

Present: Andrei, Tom, Marc and Lars (Customer)

We showed Lars the design prototype to receive feedback. He had a few comments on the devices main screen. He did not like that that all sliders are visible when a device is turned on. This would especially clutter the screen too much if a device has more than one slider (for example a Philips Hue light with an intensity- and color slider). So, we have change the design a bit to hide the sliders from the main screen (we discussed this afterwards see other meeting notes). There could potentially also be devices with only a slider and not an on/off switch.

He also did not like the categorization in device categories. This should not be done or at least not by device category. Categorization by room could be an option. Adding an icon to a device that indicates the device category is sufficient.

Marc mentioned that he had problems with installing the Hestia Server on Raspberry Pi (Cryptography package error). Lars said that he was planning to do an update.

Lars would like to have the Architecture Document and Requirements Document. He also likes to have updates by mail on how things are going with the project.
